1955-2000: SWITZERLAND

Population risk of dying at ages 0-34

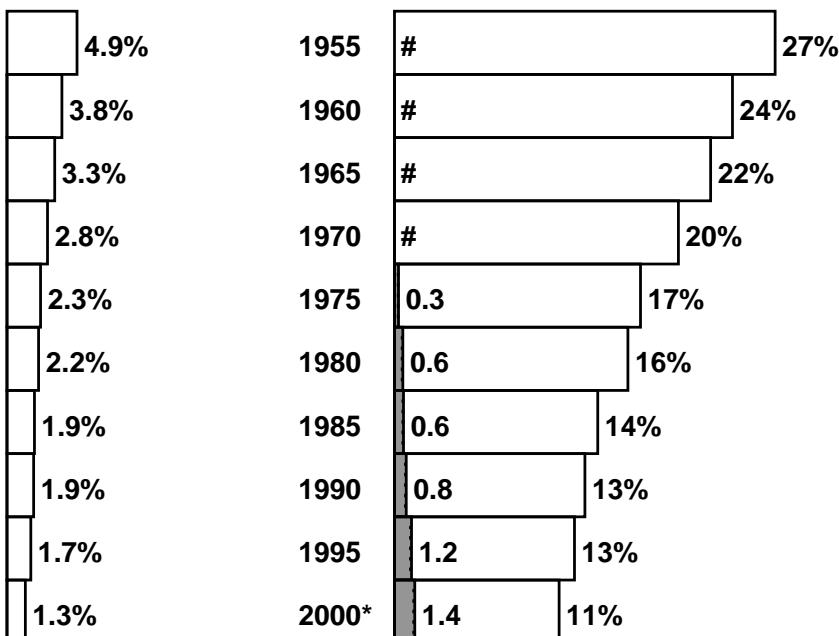

Population risk of a 35-year-old dying at ages 35-69 from smoking (shaded) or from any cause (shaded and white)

*eg, at year 2000 male death rates, out of 100 men aged 35, 21 would die before age 70 (with 6 of these deaths attributed to smoking)

MALE

Note: Most of those killed by smoking would otherwise have survived beyond age 70, but a minority (shaded area to right of dotted line) would have died by 70 anyway

FEMALE

Real risk too low to estimate reliably
